

MONASH INFORMATION TECHNOLOGY

Towards self-securing software systems

Professor John Grundy
Dr Mohamed Abdelrazek – Deakin
Dr Amani Ibrahim - Deakin

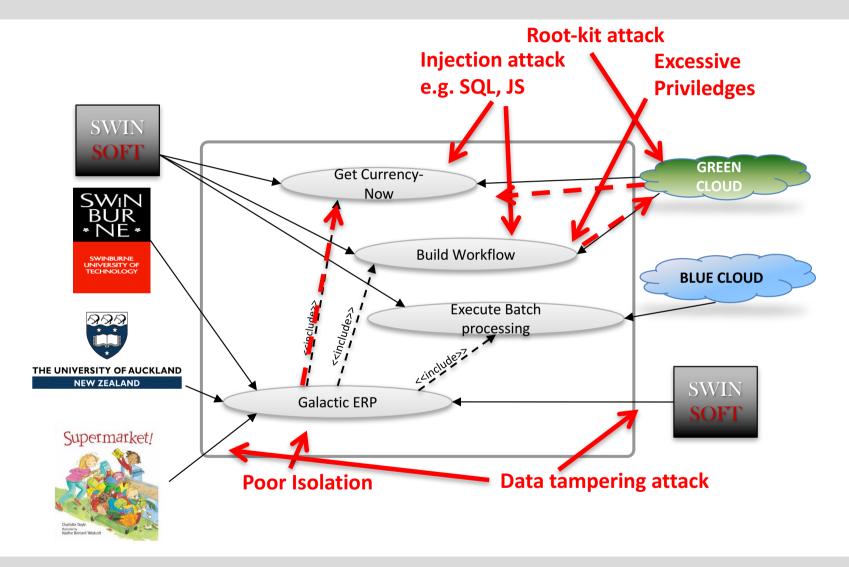

Outline

- Motivating example
- Some (partial) solutions we have been working on:
 - Static vulnerability analysis
 - Log / metric correlation analysis (dynamic analysis)
 - Run-time cloud monitoring via generated probes (static & dynamic)
 - Mitigation via run-time software update (models @ run-time approach)
- Future directions...

Motivation

"Self-securing" Software Systems

Some key challenges:

- When engineer cloud applications, don't know what other apps be deployed with, hardware deployed on, networks etc
- Stakeholder requirements change esp multi-tenant cloud apps
- New threats continually emerging
- Design-time fixing / re-deploying too slow, leaves system vulnerable

• Idea is to have the software itself:

- Identify emergent threats even as its environment changes
- Identify mitigations to the threats
- Self-adapt the application(s) while in use to counter the threat

Technique #1 – Vulnerability analysis

- Part of larger "model-driven security engineering @ run-time" (MDSE@R) platform (another talk for another day... ☺)
- Formalise the OWSAP and CAPEC database of security vulnerabilities into "signatures"; search for these in code/models
- Handles code vulnerability detection and design, architecture vulnerability detection & security "metrics"
- Some vulnerabilities have a "mitigation" some can apply at run-time using MDSE@R platform (run-time security enforcement) and/or our "Re-aspects" framework (run-time .NET code updating)

Examples...

```
Public bool LogUser(string username, string password) {
   string query = "SELECT username FROM Users WHERE
   UserID = "username" AND Password = "+ password + "";
```

Figure 2. A code snippet vulnerable to SQLI attack

Figure 3. A code snippet vulnerable to authentication Bypass

Figure 4. A code snippet vulnerable to improper authz

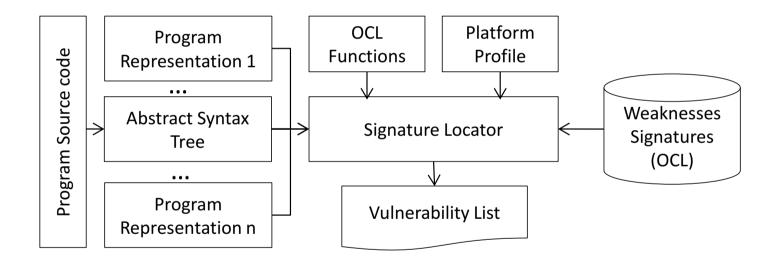

Formal vulnerability signatures

Vul.	Vulnerability Signature (Simplified!!)
SQLI	Method.Contains(S : MethodCall S.FnName = "ExecuteQuery" AND
	S.Arguments.Contains(X : IdentifierExpression X.Contains(InputSource)))
XSS	Method.Contains(S : AssignmentStatement S.RightPart.Contains(InputSource)
	AND
	S.LeftPart.Contains(OutputTarget))
Improper Authn.	Method.IsPublic == true AND Method.Contains(S : MethodCall
	S.IsAuthenitcationFn == true AND S.Parent == IFElseStmt AND
	S.Parent.Condition.Contains(InputSource))
Improper Authz.	Method.IsPublic == true AND Method.Contains(S : Expression S.Contains(X:
	InputSource X.IsSanitized == False OR X.IsAuthorized == False)

SMART (Static) Analyser

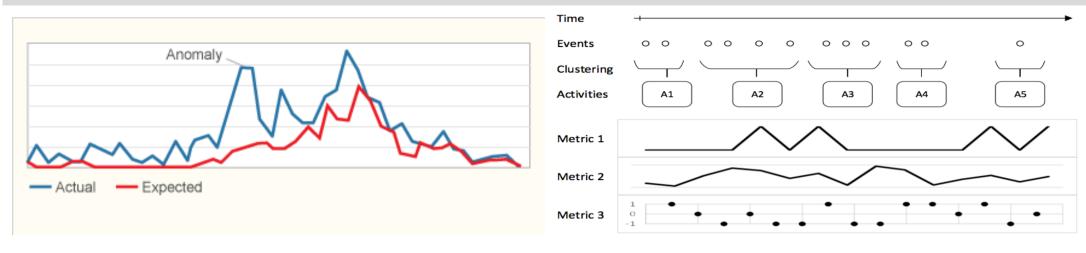

Technique #2 – log file/cloud PaaS metric analysis (dynamic analysis)

- Applied to large scale cloud operations e.g. rolling upgrade
- These complex operations often fall over due to various issues encountered during the operation
- Detecting and fixing is (very) hard
- Our approach take log file & monitor cloud metrics do correlation analysis to determine occurrence of cloud operation exceptions
- Aim to generate assertions / monitors to determine proactively different cloud operation exceptions
- Lots of challenges detail in logs; log collection timings; access to detailed cloud metrics; metric capture frequency and accuracy; ...

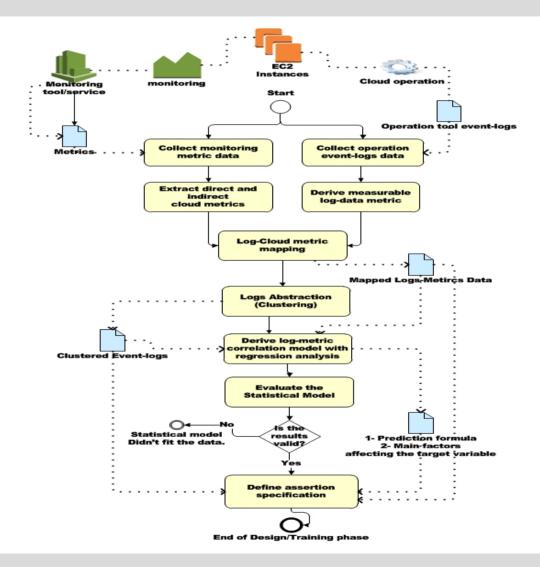

Anomaly detection

com.netflix.asgard.Task 2013-11-27_16:48:30 1401: {Ticket: null} {User: null} {Client: localhost 0:0:0:0:0:0:0:1%0} {Region: ap-southeast-2} [Pushing ami-4f36aa75 into group ASG-dsn for app ASG] Instance ASG on i-cdab74f1 is ready for use. 10 of 10 instance relaunches done. Process...

Correlation analysis

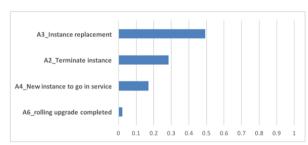

a) Predictors Importance for StartedInstances

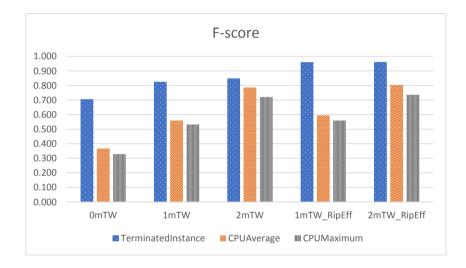

c) Predictors Importance for TerminatedInstances

b) Predictors Importance for CPUUtilizationMaximum

d) Predictors Importance for InserviceInstances

Technique #3 – monitoring probe generation

- How do we better monitor run-time metrics?
- Specify metrics and security constraints of interest similar to vulnerability signatures
- Process application model to determine where to monitor
- Inject "probes" at run-time to monitor (using variety of techniques)
- Capture data, metrics
- Determine exceptions, mitigations
- Action mitigations...

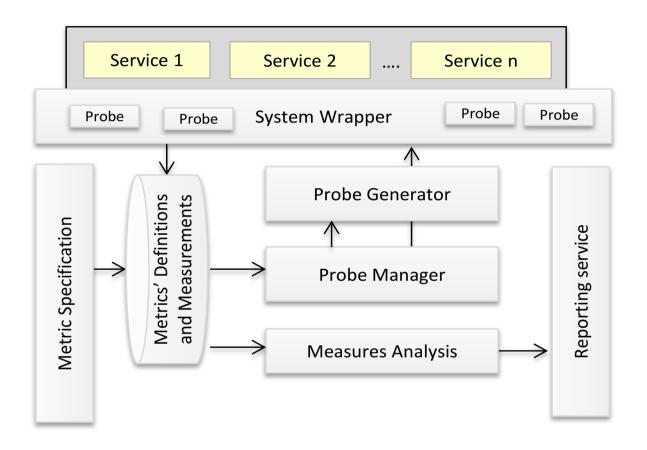

Example signatures of security metrics/properties in OCL

Metric	Signature
Information Disclosure	context Method inv InfoDisclosure: Let access: Request := self.Requests->last() in Let authorized: Response := self.AuthorizationControl.Responses-> select(R R.IsValid = True AND access.UserID = R.UserID)->last() in IF (authorized) THEN true ENDIF
Chinese Wall	Let Subject := Classes->select(Name = 'Subj')->first() in Let Obj: Class := Classes->select(Name = 'Object')->first() Let mthdCall : Request := self.Requests->last() in Let mthdReturn: Response := self.Responses->last() in Let access : Request := self.Requests->last() in IF (access.RequestTime > mthdCall.RequestTime and access.RequestTime < mthdReturn.ResponseTime) THEN Not self.Conflictlist->exists(R R = access.Target)
Restrict System Calls	Let SystemCalls : Request := Classes->select(Name = 'SystemHandler')->first().Requests()->last() in IF (SystemCalls <> null) THEN false ENDIF
Separation of Duties	Let xReq: Request:= Requests(Entity = 'MthdX') in Let yReq: Request:= >Requests(Entity = 'MthdY') in Let zReq: Request:= >Requests(Entity = 'MthdZ') in IF (xReq.UserID = yReq.UserID and xReq.Target = yReq.Target Or xReq.UserID = zReq.UserID and zReq.Target = zReq.Target Or yReq.UserID = zReq.UserID and xReq.Target = yReq.Target) THEN false ENDIF
Authenticated Requests	context System inv <u>AuthenticatedRequests</u> : self.AuthenticationControl.Requests->select()->count()/ self.Request->select()->count()
Authentic Requests	<pre>context System inv <u>AuthenticRequests</u>: self.AuthenticationControl.Response->select(R R.IsValid = true)->count()/ self.AuthenticationControl.Request->select()- >count()</pre>
Last(10) Authz. Reqs	context System inv <u>Last10AuthzCtl</u> : self.AuthorizationControl.Requests->select()->Last(10)
Top(10) admin Requests	context System inv <u>Top10AuthnCtl</u> : self.AuthenticationControl.Responses->select(R R.UserID = 'Admin')->count()
Mean Time Between Unauthentic Request	context System inv MTBUnauthenticRequests: self.AuthenticationControl.Responses->select(R R.IsValid = false)>differences('Measurementtime')-> sum() / self.AuthenticationControl.Responses->select(R R.IsValid = false))->count() context System inv Authenticated RequestsTrend: self.AuthenticatedRequests.Differences('AuthenticatedRequests')->sum() / self.AuthenticatedRequests-> count()
Authenticated Requests Trend	
MTBUR Over Systems	context System inv <u>MTBUROverSystems</u> : self.MTBUnauthenticRequests->sum()/ self.MTBUnauthenticRequests->count()

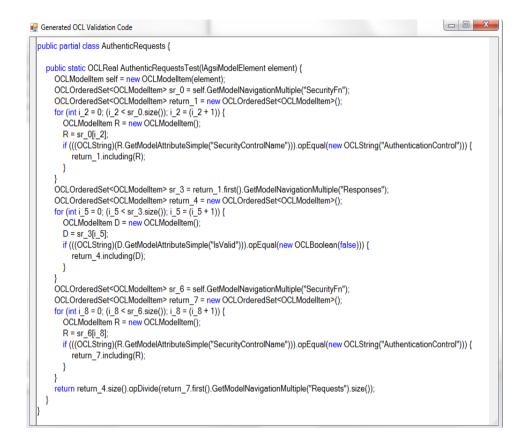

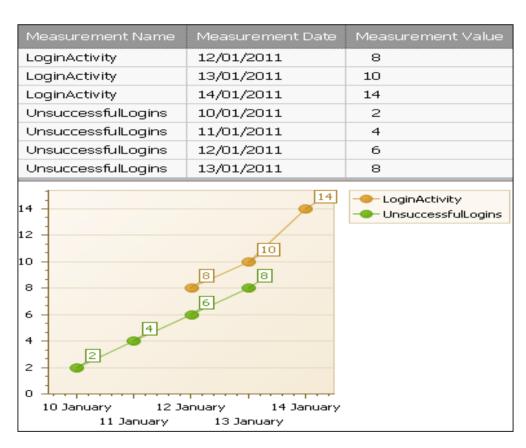

Process

Results

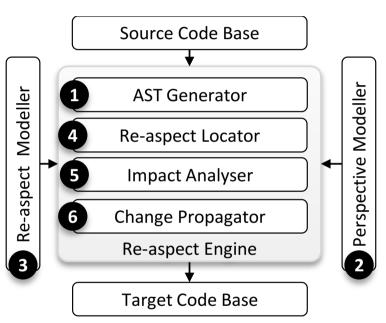

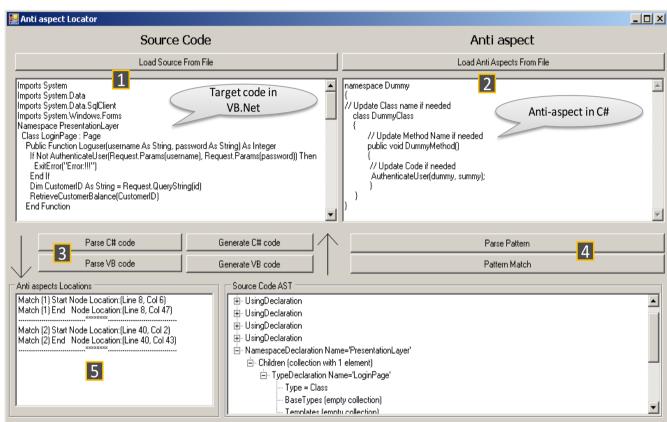

Technique #4 – run-time mitigation

- Found vulnerability (statically or dynamically, at design-time or runtime); found anomaly – how fix / mitigate / raise alarm??
- Use one (or more) of previous techniques to identify security flaw / vulnerability / new attack scenario / anomalous measurement(s) / event(s) at run-time
- Identify feasible modification to application to address
- Update the application on-the-fly to address vulnerability / security flaw / counter attack scenario / mitigate for anomaly
- Validate that vulnerability etc has been addressed
- The beginnings of the notion of "self-securing software systems"...

SMART Tool – code updater

Fix ups of vulnerable code

Figure 3: Case 2: code vulnerable to authentication bypass, to replace

```
bool updateCustomerBalance(string custID, decimal nBalance) {
    if(!AuthenitcateUser( username, password)) return false;
    if(!AuthorzUser(username, "updateCustBalance")) return false;
    LogTrx(username, dateTime.Now, "updateCustomerBalance");
    Customer customer = Customers.getCustomerByID(custID);
    customer.Balance = nBalance;
    Customers.SaveChanges();
    LogTrx(username, dateTime.Now, "updateCustBalance done");
}
```

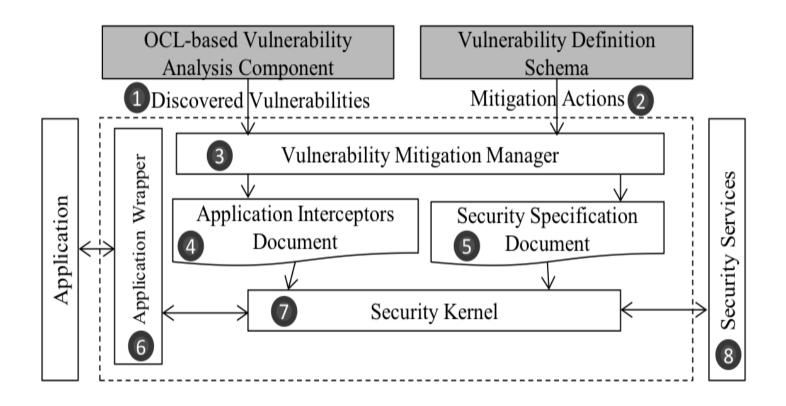

Figure 2: Case 1: code with old security functions, we want to leave out

Figure 6: Case 4: code vulnerable to improper authorization, to inject

```
Inputsanitizer( (new StakeFrame()).GetMethod().GetParameters() );
string query = "SELECT * FROM USERS WHERE UserID = ""
+ EncodeForSQL(username) + "" AND password = ""
+ EncodeForSQL(password) + """;
```

Figure 5: Case 3b: Code vulnerable to SQL injection, to modify

Run-time mitigation architecture via reconfiguration

All is not as it may seem...

- Can compare systems in the same domain but appearances can be (very) deceiving...
- Vulnerability Counts vs Metrics vs meaning
 - need to compare like with like
 - Criticality of the issue vs simple occurrences
 - System scale makes a large difference
- Just one critical weakness can cause whole system to be compromised under attack; lots of minor weaknesses may be tolerable
- Its rather slow to analyse many of these => non-real time
- Change to environment / co-deployed services/applications => changes to measures / counts...
- Run-time vulnerability analysis still emerging area

Current / future work

- Further formalisation of the OWSAP and CAPEC databases of security vulnerabilities (IMO one of the real contributions we have undersold...)
- Apply deep learning to static, dynamic vulnerability detection vs rule-based (DIGGER, SMART) and statistical-based (log analysis) approaches have a group of leading experts @ Deakin on this ©
- Implies have good training set but...
- Implies have good vector model for input to the RNN-based learnercbut...
- Supporting tenants to specify their security requirements is... Really hard!
- Zero-day threat detection at laaS level extremely hard but working on how to apply to IoT security analysis and mitigation

Questions...
